

REFIBRA™

Refibra™ branded lyocell fibers are made from post-industrial cotton scraps left over from cutting operations and wood. Reducing the need to extract additional raw materials from nature lowers the impact on natural resources. Thus Refibra™ fibers have initiated an important step towards circular economy for textiles.

The need for clothing will have doubled by the year 2025. This amount of clothing signals a major burden for our environment. 80% of the clothing we throw away ends up in landfills. An estimated 50 million tons of clothing are thrown away every year.
